Your chatbot has a computer – text version of the video

A text version of the video, for anyone who cannot watch it.

About this document

The video is 1 minute 13 seconds long. It is narrated by Steven Williams, and captions are available. The only sound is the narration: there is no music and there are no sound effects.

This version follows the video in order, with approximate timings. In each section, “Narration” gives the spoken words as they appear in the captions, “On screen” gives the exact words shown in the video, and “What you see” describes the pictures and movement.

The video opens on the tip card: an index card on pale blue paper, with a red rule under its header and faint blue lines under its headline. The camera then zooms into the card’s white panel, where the explanation is drawn with navy outline icons in pale blue circles, and a blue speech bubble stands for the language model. At the end, the camera zooms back out to the card.

If you find any problems with this document or the video, please contact Steven Williams at s.williams10@lse.ac.uk.

1. The tip card

0:00 to 0:03

Narration

Your chatbot has a computer.

On screen

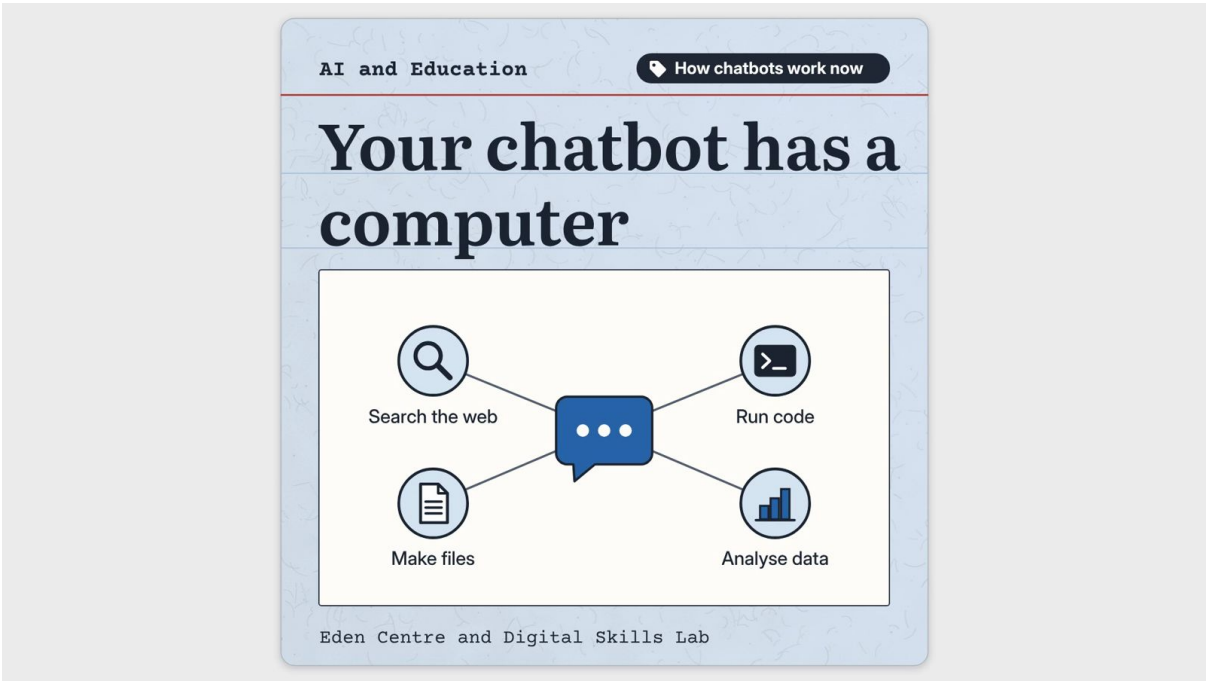

The card, from top to bottom:

- AI and Education
- How chatbots work now (a label with a tag icon)
- Your chatbot has a computer (the headline)
- Search the web, Run code, Make files, Analyse data (four labels around a speech bubble)
- Eden Centre and Digital Skills Lab (the footer)

What you see

The video opens on the full tip card, held in silence for a moment and then while the title is spoken. In the card's white panel, a blue speech bubble with three white dots sits in the centre, joined by grey lines to four icons in circles: a magnifying glass for "Search the web", a terminal window for "Run code", a document for "Make files" and a bar chart for "Analyse data".

After the title, the camera zooms in on the white panel until it fills most of the screen, with a narrow border of the card's blue paper still visible around it.

The tip card at the start of the video.

2. When ChatGPT launched

0:03 to 0:11

Narration

When ChatGPT first launched, a chatbot was just a large language model. You typed text in, and it wrote text back.

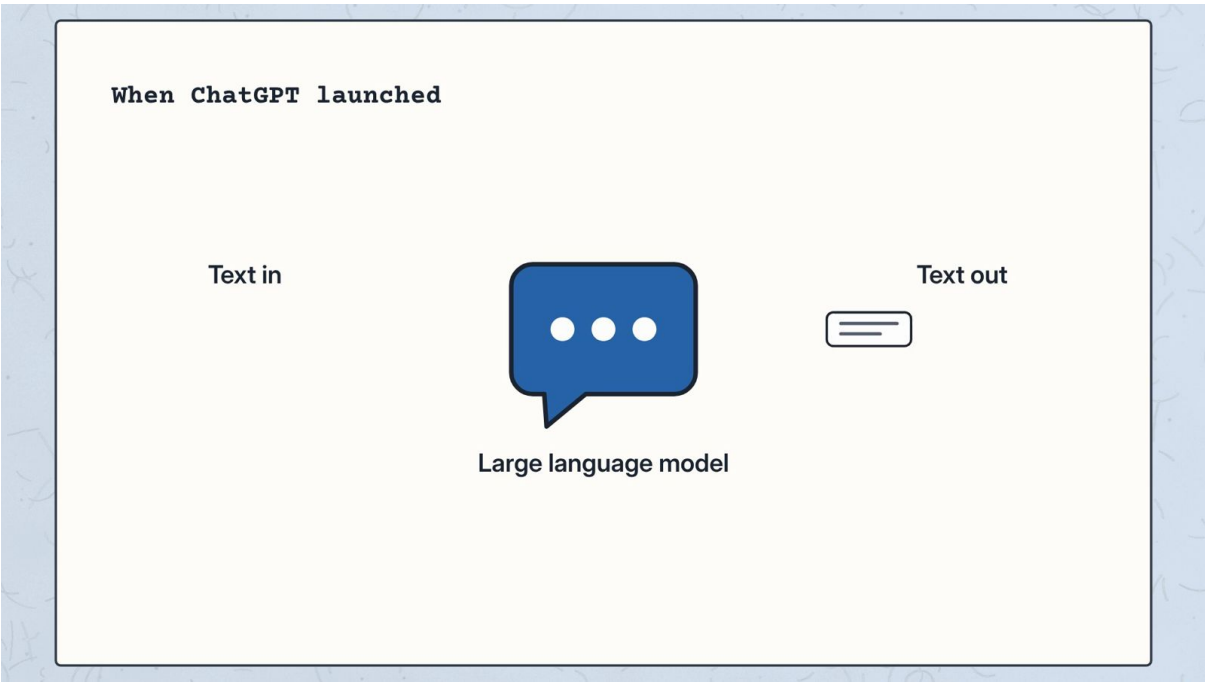

On screen

- When ChatGPT launched (top left)
- Large language model
- Text in
- Text out

What you see

“When ChatGPT launched” appears in the top-left corner. The four icons and their lines fade away, leaving only the speech bubble in the centre, with the label “Large language model” beneath it.

A small white card with two grey lines, standing for text, slides in from the left and shrinks into the bubble, under the label “Text in”. Then a similar card slides out of the bubble to the right, under the label “Text out”.

Text in, text out: a chatbot when ChatGPT first launched.

3. The harness

0:11 to 0:18

Narration

Today, chatbots like Claude and Copilot put the language model inside a harness of software and tools

On screen

- Today: chatbots like Claude and Copilot (top left)
- The harness: software and tools
- Large language model

What you see

The text cards and their labels clear, and the words in the top-left corner change to “Today: chatbots like Claude and Copilot”.

The speech bubble moves slightly to the left. A rounded, pale blue box with a navy outline draws itself around it, and the label “The harness: software and tools” appears at the top of the box. The “Large language model” label stays beneath the bubble, inside the box.

4. The tools

0:18 to 0:26

Narration

that includes web search and often a computer in the cloud, where it can run code, make files and analyse data.

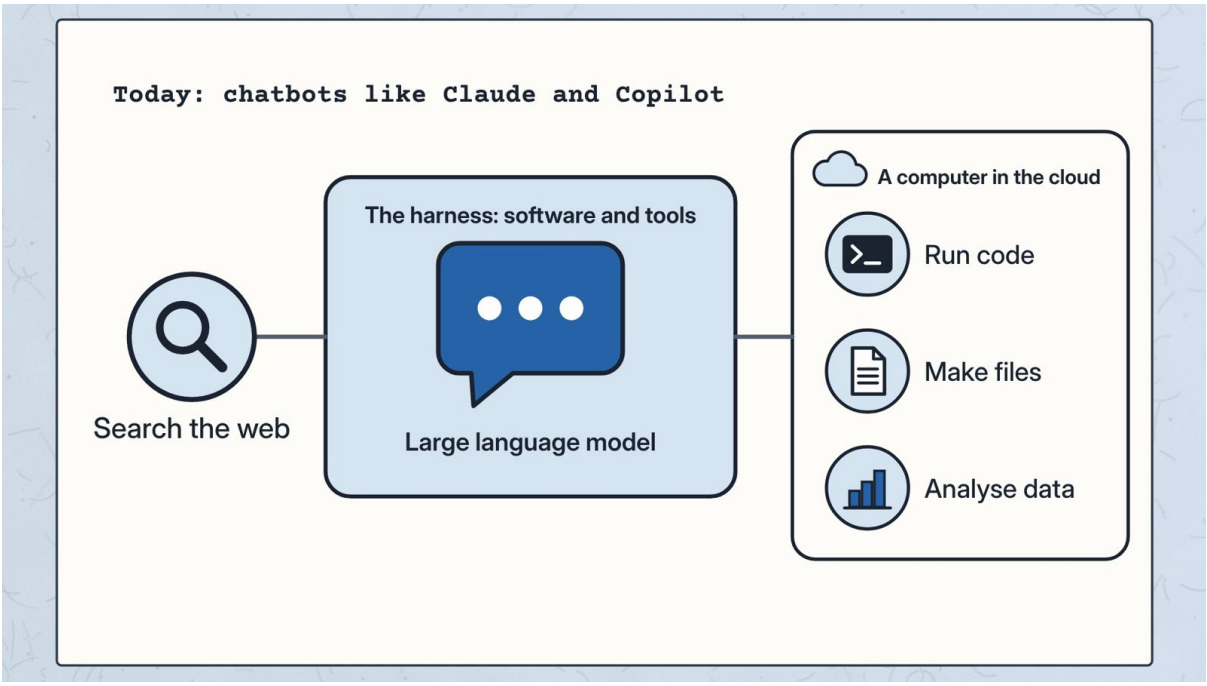

On screen

- Search the web
- A computer in the cloud
- Run code
- Make files
- Analyse data

What you see

Each part appears as it is named. A grey line extends to the left of the harness, and the magnifying-glass icon appears at its end, labelled “Search the web”.

A second line extends to the right, and a tall white panel draws itself there, headed with a small cloud icon and “A computer in the cloud”. Inside it, three icons appear one below another, each with its label to the right: the terminal window (“Run code”), the document (“Make files”) and the bar chart (“Analyse data”).

The harness, joined to web search and a computer in the cloud.

5. Test and fix

0:26 to 0:33

Narration

Depending on how sophisticated the harness is, it can even test what it's made and fix any problems before showing you the result.

On screen

Beneath the harness, in three steps joined by arrows:

- Test
- Fix
- Show you

What you see

A blue circular arrow spins once around the "Run code" icon as "Test" appears beneath the harness, and spins again as "Fix" appears after it. Then "Show you" completes the line, and a small blue badge with a white tick appears on the "Run code" icon.

6. Made from code

0:33 to 0:38

Narration

That's how a chatbot can make an MP4 video entirely from code, like the animation you're watching now.

On screen

- video.mp4
- Made from code, like this video

What you see

The test-and-fix steps and the circular arrow fade. A white file card with a blue play button and the file name “video.mp4” slides out of the “Make files” icon and grows as it moves to its place beneath the harness. The label “Made from code, like this video” appears below it.

7. Why the harness matters

0:38 to 0:44

Narration

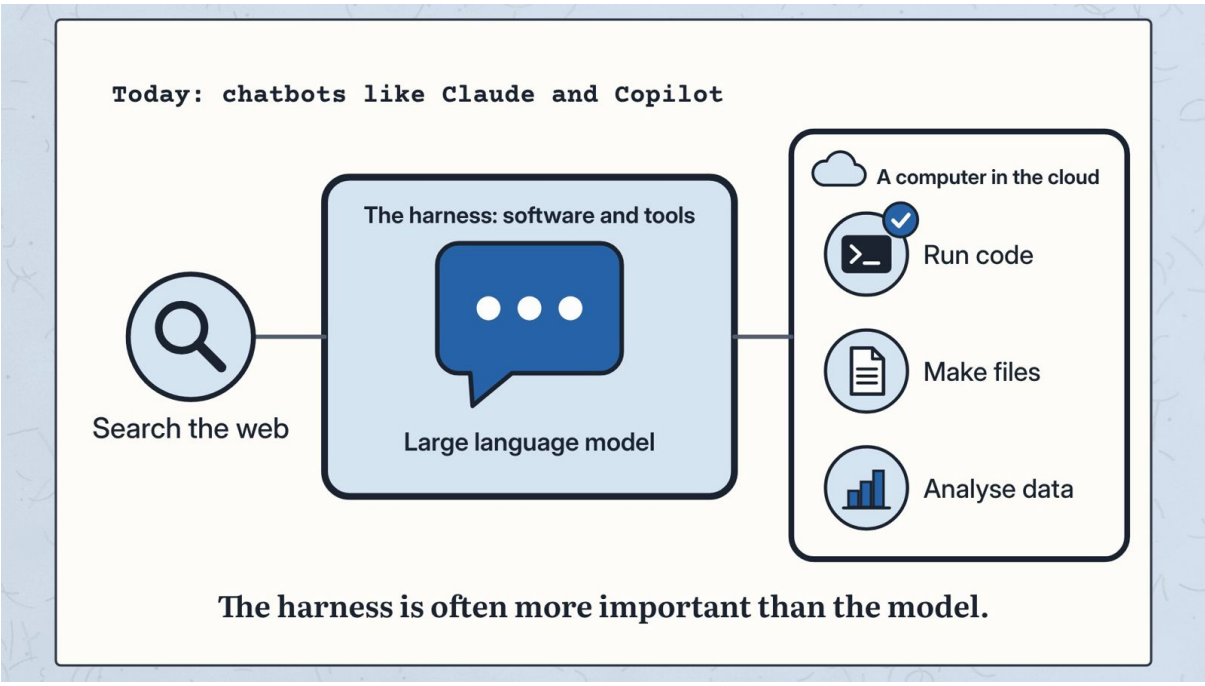

For this and many other reasons, the harness is often more important than the model in many cases.

On screen

- The harness is often more important than the model.

What you see

The video file and its label fade. The outlines of the harness and of the cloud computer panel thicken, and the sentence appears at the bottom of the screen in the card’s serif typeface.

Why the harness matters.

8. Try this

0:44 to 1:02

Narration

Try this: pick Claude Opus 5.5 in both Claude and Copilot, and give each the same request. Ask for a 20-second animated video on a topic of your choice, as an MP4 file you can download, and ask it to check the video plays before it shares it.

On screen

- Try this (top left)
- Claude
- Copilot
- Claude Opus 5.5 (beneath each speech bubble)

The request, in a chat box:

- Make a 20-second animated video about [topic of your choice] as an mp4 file I can download.
- Check it plays correctly before you share it.

What you see

The diagram clears, and “Try this” appears in the top-left corner. Two blue speech bubbles appear side by side, each labelled “Claude Opus 5.5”. A pale blue box draws itself around the left bubble, labelled “Claude”, and then around the right bubble, labelled “Copilot”.

As the request is described, an empty white chat box appears beneath them, with a slowly blinking text cursor. Just after the narration says “you can download”, the first sentence of the request appears in full, and the cursor moves down to the next line. Just after “before it shares it”, the second sentence appears and the cursor stops. Two small cards, standing for copies of the request, then rise from the chat box, one to each box.

9. Same model, different harness

1:02 to 1:07

Narration

Then compare what you get back.

(A short pause.)

Same model. Different harness.

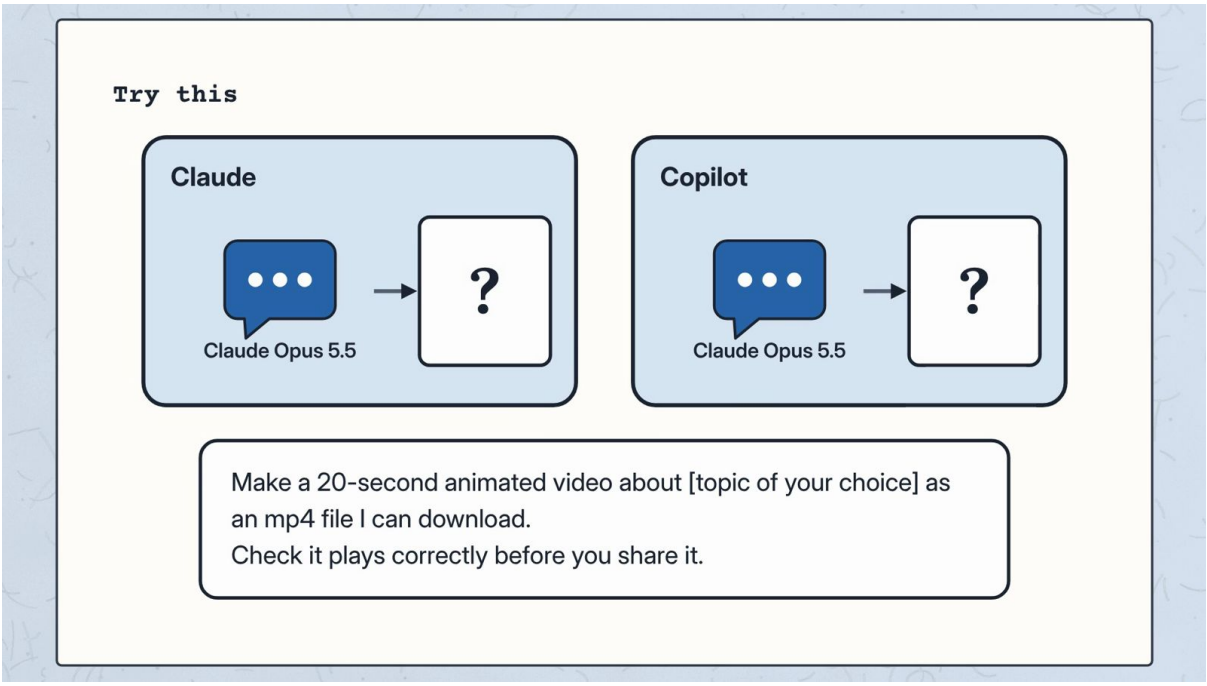

On screen

- ? (one in each box)
- Same model, different harness.

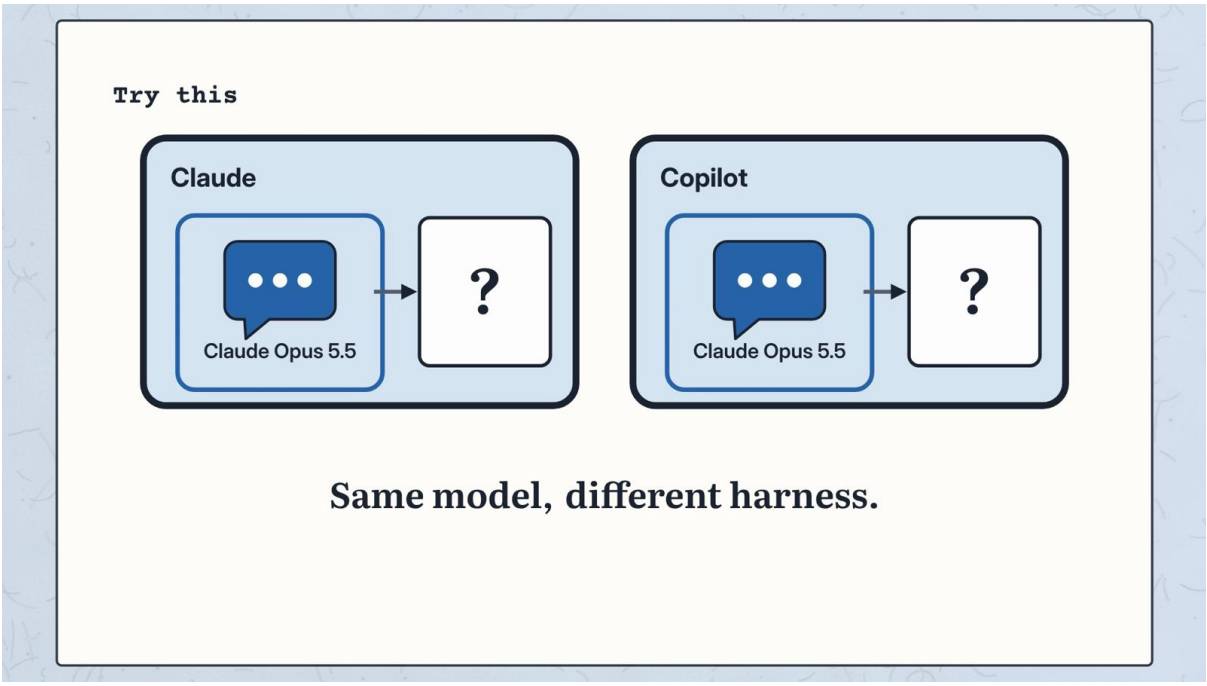

What you see

In each box, an arrow points from the speech bubble to a white card with a large question mark, first in the Claude box and then in the Copilot box. The request is still visible beneath them.

After a short pause, the chat box fades. A blue outline appears around both speech bubbles as “Same model,” appears beneath the boxes. Then the outlines of both boxes thicken as “different harness.” completes the line.

The same request, sent to the same model in two different harnesses.

Same model, different harness.

10. Back to the card

1:07 to 1:13

Narration

You'll find the full prompt and links to further reading in the post.

On screen

The tip card, with the same words as in section 1.

What you see

The boxes and text fade, and the card's own speech bubble, four icons and lines return to the white panel. The camera zooms back out to show the full tip card, as at the start, and holds on it for about three seconds before the video ends.
